                                                                                                                                                                                                   The invention relates to a novel oligomeric particle comprising hepatitis C virus (HCV) envelope proteins, with a diameter of 1-100 nm. The invention also encompasses a purified HCV envelope protein (preferably El or Els), specific antibodies generated against the oligomeric particles, or a single HCV envelope protein, and methods for detection of HCV antigens and antibodies. The HCV envelope oligomeric particles are highly immunogenic when presented to chronic HCV carriers, comprise a T-cell stimulating antigen such as core protein, El, E2, NS2, NS3, NS4A, NS4B, NS5A or NS5B. The oligomeric particle of the invention may be used in vaccine compositions against HCV and for inducing immunity against HCV in chronic HCV carriers, especially prior to, simultaneously with, or after any other therapy. They may be used for after liver transplantation or after presumed infection and also for prophylactically inducing immunity against HCV in HCV-infected individuals prior to rafter liver transplantation or after presumed infection and also for prophylactically inducing immunity against HCV antibodies raised to detect HCV antibodies raised against the oligomeric particles are used to detect HCV antibodies in a sample, and to detect HCV related T cell responses. Prior art methods for HCV vaccination have been unsuccessful. Prophylactic vaccination has also only been shown to be effective against a homologous strain of HCV. The present invention provides and any particles are used to detect HCV. The Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY69652-Y69654 represent HCV El protein fragments referred to in an exemplification of the present invention. AAY69652 represents an El fragment from HCV subtype la and AAY69653-Y60654 represent El fragments from two different HVC subtype lb strains.
                                                                                                                    Novel HCV envelope protein particles used for vaccination against HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Patent No. 574723
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: SYNTHETIC PEPTIDES SPECIFIC FOR
TITLE OF INVENTION: THE DETECTION OF ANTIBODIES TO HCV, DIAGNOSIS OF HCV
TITLE OF INVENTION: INFECTION AND PREVENTION THEREOF AS VACCINES
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 49; DB 1; Length 44; ilarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 130, Application US/08262037
Patent No. 5747239
GENERAL INFORMATION:
APPLICANT: Chang YI Wang and Barbara Hosein
TITLE OF INVENTION: SYNTHETIC PEPTIDES SPECIFIC FOR
TITLE OF INVENTION: THE DETECTION OF ANTIBODIES TO HCV, DIAGNOSIS OF HCV
TITLE OF INVENTION: INFECTION AND PREVENTION THEREOF AS VACCINES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 49; DB 1; Length 44; 100.0%; Pred. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A. Molecule type: genomic RNA
A. Residues: 1-550 <LIID
A. Residues: 1-550 <LIID
A. Construction of the nucleotide sequence is not complete
A. Note: the nucleotide sequence is not complete
A. Note: translation of the nucleotide sequence is not complete
C. Superfamily: hepatitis C virus genome polyprotein
C. Superfamily: hepatitis C virus genome polyprotein
C. Reywords: envelope protein: glycoprotein; nonstructural protein; nucleocapsid; poly
F. 1-190/Product: envelope protein El #status predicted <CPC>
F. 191-380/Product: envelope protein E2 or nonstructural protein NS1 (fragment) #status
F. 381-514/Product: envelope protein E2 or nonstructural protein NS5 (fragment) #status
F. 196, 233, 250, 305, 416, 422, 429, 447/Binding site: carbohydrate (Asn) (covalent) #status
                                                                                                                                                                                                                    genome polyprotein - hepatitis C virus (strain PRC1) (fragments)
N;Contains: envelope protein E1; envelope protein E2; nonstructural protein NS1; nons C;Species: hepatitis C virus
C;Species: hepatitis C virus
C;Date: 17-Apr-1993 #sequence_revision 17-Apr-1993 #text_change 17-Nov-2000

Second polyprotein - hepatitis C virus (isolate EG-1) (fragment)
N;Contains: envelope protein E1
N;Contains: envelope protein E1
C;Species: hepatitis C virus
A;Variety: isolate EG-1
C;Date: 06-Jan-1995 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C;Dates: 06-Jul-1996 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C;Decreasion: S32743
A;Respectation: Variability of the envelope regions of HCV in Buropean isolates and it A;Residues: 1-177 < RGC>
A;Rolecule type: genomic RNA
A;Residues: 1-177 < RGC>
A;Cross-references: EMBL:X72980; NID:g296104; PIDN:CAA51485.1; PID:g296105
A;Cross-references: EMBL:X72980; NID:g296104; PIDN:CAA51485.1; PID:g296105
C;Superfamily: hepatitis C virus genome polyprotein
C;Keywords: envelope protein E1 #status predicted <AMAT>

C;Species: hepatitis C virus
C;Species: h
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        genome polyprotein - hepatitis C virus (isolate CR-1) (fragment)
N;Contains: envelope protein E1
C;Species: hepatitis C virus
A;Variety: isolate CR-1
C;Date: 06-Jan-1995 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
                                                                                                                                                                                                                                                                                                                     A Molecule type: genomic RNA

genome polyprotein - hepatitis C virus (isolate EG-2) (fragment)
N;Contains: envelope protein E1
N;Contains: envelope protein E1
N;Contains: hepatitis C virus
A;Variety: isolate EG-2
C;Decies: hepatitis C virus
A;Variety: isolate EG-2
C;Date: O6-Jan-1995 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C;Accession: S32745
R;Roggendorf, M:; Lu, M:; Fuchs, G.; Ernst, G.; Hoehne, M.; Schreier, E.
Submitted to the EMBL Data Library, February 1993
A;Description: Variability of the envelope regions of HCV in European isolates and it
A;Reference number: S32741
A;Reference number: S32741
A;Molecule type: genomic RNA
A;Molecule type: genomic RNA
A;Residues: 1-177 <ROGS
A;Cross-references: EMBL:X72982; NID:9296108; FIDN:CAA51487.1; PID:9296109

$32746
genome polyprotein - hepatitis C virus (isolate HU-1) (fragment)
N.Contains: envelope protein E1
C;Species: hepatitis C virus
A;Variety: isolate HU-1
C;Bocles: hepatitis C virus
A;Variety: isolate HU-1
C;Date: 06-Jan-1995 #sequence_revision 26-Jul-1996 #text_change 17-Nov-2000
C;Accession: $32746
B;Roggendorf, M.; Lu, M.; Fuchs, G.; Ernst, G.; Hoehne, M.; Schreier, E.
submitted to the ReMEL Data Library, February 1993
A;Description: Variability of the envelope regions of HCV in European isolates A;Reference number: $32741
A;Reference number: $32741
A;Anolecule type: genomic RNA
A;Residues: 1-177 <ROG>

16-OCT-2001 (Rel. 40, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7: Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate 1) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-1- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIXCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN CAND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SMART; SMO0492; HELICG3; 1. Pransferase; RNA-directed RNA polymerase; Polyprotein; Glycoprotein; Envelope protein; Helicase; ATP-binding; Transmembrane; Nonstructural protein; Hydrolase; Serine protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Choo Q.-L., Richman K.H., Han J.H., Berger K., Lee C., Dong C., Gallegos C., Coit D., Medina-Selby A., Barr P.J., Weiner A.J., Bradley D.W., Kuo G., Houghton M.;

                                                                                                                                                                                                                                                                                                                                                                     -:- FUNCTION: OS BEENS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
-:- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIROS REPLICATION.
-:- CATALYTIC ACTIVITY: HYDROLYSIS OF FOUR PEPTIGE bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
-:- SUBBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
-:- PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES.
-:- SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY C18.
                                                                                                                                                                                                                                                                                        -!- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3-
-!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF
NS3-NS4A, NS4A-NS4B, NS4D-NS5A AND NS5A-NS5B.
-!- FUNCTION: NS4A FORMS, A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE

Envelope plyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1)] (Fragment)
-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSTILE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN MEM GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MINA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus (isolate HCV-476) (HCV).

"Genomic characterization and mutation rate of hepatitis C virus isolated from a patient who contracted hepatitis during an epidemic of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2729(1992).
-!- SUBUNIT THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN A AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                             R InterPro; IPR002531; HCV_capsid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-AUG-1992 (Rel. 23, Created)
01-AUG-1992 (Rel. 23, Last sequence update)
16-CGT-2001 (Rel. 40, Last annotation update)
Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
                                                    Abe K., Inchauspe G., Fujisawa K.;
"Genomic characterization and mutation rate of hepatitis C virus isolated from a patient who contracted hepatitis during an epidemic of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2729(1992).
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN BAVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Transmembrane; Nonstructural protein.
INIT_MET 1 REMOVED FROM CAPSID PROTEIN C BY THE CELLULAR AMINOPEPTIDASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-LINKED (GLCNAC...) (POTENTIAL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

PROPEINON: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

C -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.

C -1- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLECCARSID COVERED BY A LIPOPROFIEIN ENVELOPE. THE ENVELOPE COMPLEX OF PROTEINS:

PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCARSID IS A COMPLEX OF PROTEIN M PROPERTY CONTINES.
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2 (GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21) (EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin) (EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein NS5A (P6); Nonstructural protein NS5A (P6); Nonstructural protein NS5A (P6); Nonstructural protein NS5A (P6); Nonstructural protein Hepatitis C virus (Isolate BK) (HCV).

Nakazawa T., Hijkata M., Ishimura Y., Shimotchno K.;
"Molecular cloning of hepatitis C virus genome from a single Japanese carier: sequence variation within the same individual and among infected individuals.";

Virus Res. 23:39-53(1992)

Use Res. 23:39-53(1992)

LEUNTON: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
C-1 CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.
C-1 SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CAPSID PROTEIN C (POTENTIAL).

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3 4.21.98); Nonstructural protein NS48 (P4); Nonstructural protein
NS48 (P27); Nonstructural protein NS54 (P56); Nonstructural protein
NS58 (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Taiwan) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NONSTRUCTURAL PROTEIN NS4A (POTENTIAL).

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
            PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CHARGE RELAY SYSTEM (BY SIMILARITY).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintain the immunological CTL response in the mammal; and (b) maintaining the lamunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. malignant melanoma or infectious diseases, e.g. viral disease such as hepaticis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAX10071 to AAX10039 represent examples of peptide antigens given in the present invention.
                                                                                                                                                                                ó
from the core, E1, E2/NS1, NS2, NS3, NS4 or NS5 regions. The peptides were tested for peptide specific cytotoxic T-cell activity. The peptides ARR84570-77 were found have substantial homology with a T-cell epitope and are useful in vaccines against HCV infection.
                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inducing a cytotoxic T lymphocyte response – by maintaining a level of antigen in the lymphatic system of a mammal so as to provide a

an immunological cytotoxic Tiyanhocyte (TL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal, and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintaining the lemmunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. malignant melanoma or infectious disease, c.c. e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the milieu of the lymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAV10071 to AAV10639 represent examples of peptide antigens given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method of inducing and/or sustaining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing a cytotoxic T lymphocyte response - by maintaining a level of antigen in the lymphatic system of a mammal so as to provide a sustained CTL response, used to treat, e.g. AIDS
                                                                                                                                                                                                                                                   Cytotoxic T-lymphocyte response; CTL; antigen; lymphatic system; immunisation; tumour; infectious disease; immunotherapy; cancer; malignant melanoma; viral disease; hepatitis; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

Sequence encoded in the hepatitis C virus (HCV) cDNA insert in clone 8h.
                                                                                                                                                                                                                 Hepatitis C virus gene - used for prodn. of polynucleotide probes, polypeptide(s) and antibodies for diagnosis, prevention and treatment of infection.
                                                                                                                                                                                                                                                                                                 The sequence is the peptide encoded by the hepatitis C virus (HCV) cDNA insert in clone 8h (see AAN90317). The polypeptides are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines.

The region shown overlaps with clone 33c.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAR84570-616, AAR84885-90 and AAR91054 are all HCV-1 derived peptides from the core, El, E2/NS1, NS2, NS3, NS4 or NS5 regions. The peptides were tested for peptides specific cytotoxic T-cell activity. The peptides AAR84570-77 were found to have substantial homology with a T-cell epitope and are useful in vaccines against HCV infection.

The DNA from the clone was used to prepare a hSOD:HCV protease fusion construct. The truncated protease analogue expressed by the resulting vector is proteolitically inactive and can be used to assay a wide range of pharmaceutical agents for controlling HCV. Those agents which inhibit the protease activity sufficiently will also inhibit viral infectivity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Clone C8h was isolated from a HCV CDNA library (ATCC 40394) using probe C8h (see AAQ14309). It was digested with EcoRI and DdeI to give a 208bp fragment. This fragment, along with fragments from clone C33c (see AAQ14303) and clone C36d (see AAQ14298), was cloned into the EcoRI site of pBR322 and transformed into E.coli HB101 to give vector C300. A 945pp Nael/EcoRI fragment from C300 was ligated to a fragment from C7f+C2Dc (see AAQ14307) and AAQ14300). A fragment from this recombinant vector was eventually used to construct a vector which
                                                                  It is the sequence encoded in the hepatitis C virus (HCV) cDNA insert in clone 8h. Tag a - the region of overlap with the HCV antigen encoded in clone 33c. It is an epitope which could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          encodes amino acids 1-151 of human Superoxide dismutase fused to amino acids 946-1630 of HCV protease. The vector (cf1SODp600) was transformed into E.coli D1210 cells and deposited as ATCC 68275.

its active truncation manages are claimed. Also new are fusion proteins comprising the protease (or analogues) and, e.g. human superoxide (SDD) or ubiquitin. The protease is essential for polyprotein processing, and thus infectivity, in HCV. The compsus. are used to screen for specific inhibitors (possibly useful as antiviral agents), to generate specific antibodies and to cleave specific polypeptides. HCV CDNA clones (AAT59250-56 encoding AAW01686-92 resp.) were isolated from HCV genomic library using probes AAT95244-49. The clones were used in the preparation of full-length SOD-protease fusion proteins.

isolated from the clone, and cloned into an expression vector to produce a fusion protein with human superoxide dismutase-protease. The HCV protease is believed to cleave left from the genomic polyprotein. In the absence of protease activity, the HCV polyprotein should remain in its unprocessed form, and thus render the virus non-infectious. Inhibitors of protease activity should therefore also inhibit viral infectivity. The protease can therefore be used for assaying compounds for activity against HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes a method for making a purified Hepatitis C virus (HCV) MS3 protease or active truncation analog. If the HCV protease N-terminal cleavage signal is excluded (so that self-cleavage is prevented), the HCV protease remains in its unprocessed form, and renders the virus noninfectious. The protease is therefore useful for assaying pharmaceutical agents for control of HCV, as compounds which inhibit protease activity sufficiently will also inhibit viral infectivity. An inactive non-cleaving protease can be used to screen for inhibitors. Recombinant expression systems can be utilised to prepare recombinant HCV which can be used to produce monoclonal antibodies. The present sequence was isolated in the course of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This protein is essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. NS4A is also needed for this process and inhibitors of the two proteins should act as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

                                                                                                                                                                                                                                                                                                                                                                                                                The catalytic domain (AAW12963) of hepatitis C virus (HCV) NS3 protease (NS3p) can be produced in soluble form by attachment of a solublishing peptide (see also AAW12964-66 and AAW09236-37) or hydrophilic tail (AAW42391-92, AAW09245-47), or in insoluble form (AAW09240), pref. with an N-terminal His tag (AAW09241) to facilitate purification. NS3p may also be expressed as a fusion to NS4A cofeactor (AAW09242). NS3p constructs can be produced in host cells using vectors contg. the encoding CDNA sequences (see also AAT42386-95) for use with novel NS3p substrates (AAW12957-62) in high throughput assays to identify HCV protease inhibitors of potential therapeutic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The catalytic domain (AAW04578) of hepatitis C virus (HCV) NS3 protease comprises the 183 N-terminal amino acids of the enzyme. NS3 cleaves the non-structural proteains that are necessary for HCV agents. The enzyme is expressed as insoluble aggregates in E. coli (see also AAW43706). Refolded, soluble, active NS3 protease is obtd. by: solubilising the aggregates in a buffer contg a denaturant; placing the solubilised protease in acidic pH buffer contg. a reducing agent: removing the denaturant while maintaining acidic pH; and raising the pH, stepwise, to about 7-8. The NS3 parotease may be expressed with a poly-histidine tag (see also AAW04582) to facilitate purification.

Sequence 12, Application

APPLICANT: Weinhelmer, Steven

APPLICANT: Weinhelmer, Steven

APPLICANT: Cladfarb, Walentina

TITLE OF INVENTION: Modified Forms of Hepatitis C NS3 Protease for

TITLE OF INVENTION: Pacilitating Inhibitor Screening and Structural Studies

TITLE OF INVENTION: Of Protease: Inhibitor Complexes

FILE REFERENCE: DB17Sequences

CURRENT APPLICATION NUMBER: US/09/478,479B

CURRENT FILING DATE: 1999-01-06

PRIOR FILING DATE: 1999-01-08

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

genome polyprotein - hepatitis C virus (strain H)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstru protein NS4; nonstructural protein NS5
C;Species: hepatitis C virus
A;Note: host Homo sapiens (man)
C;Date: host Homo sapiens (man)
C;Accession: A36814; A41546
R;Inchauspe, G; Zebede, S.; Lee, D.H.; Sugitani, M.; Nasoff, M.; Prince, A.M.
Submitted to GenBank, July 1992
A;Description: Genomic structure of the human prototype strain H of hepatitis C virus
A;Reference number: A36814
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                F;1616-1862/Product: nonstructural protein NS4a #status predicted <N4A>

A;Variety: isolate JKI
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 23-Mar-2001
C;Accession: S18030; S33570; A48332; S18029
R;Honda, M.; Kaneko, S.; Masashi, U.; Kobayashi, K.; Murakami, S.
Submitted to the EMBL Data Library, September 1991
A;Description: A whole genome of hepatitis C virus cDNA was isolated from a single patie
A;Reference number: S18028
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genome polyprotein - hepatitis C virus (isolate JK1)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructu
protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A; Experimental source: isolate JK1 from an individual standard, S. Sthonda, M.; Kandawal, M.; Kobayashi, K.; Murakami, S. Arch. Virol. 128, 163-169, 1993
